

PUTTING THE POWER OF THE PUBLIC CLOUD TO WORK WITH VIATEK

Of all the technology trends that have had an impact on the business world, one of the most significant has been the rise of cloud computing.

Freed from the need to deploy and manage resources on premises, organisations can instead 'rent' the compute and storage capacity they require to support their operations. As a result, those resources can be readily scaled to match demands, keeping a lid on operational costs.

As demand for public cloud capacity grows, large-scale providers, such as Microsoft, Amazon, and Google, continue to increase their public cloud resources. The massive data centres they are building will support the growth of the public cloud for years to come.

THE VIATEK APPROACH

To provide the most cost-effective IT platforms for its clients, Viatek has gained a comprehensive understanding of what the public cloud has to offer and how it can be best put to work by organisations of all sizes.

Whether it's a need for additional storage, scalable compute power, or hosted communications services, Viatek is well placed to put the public cloud to work for you. Our public cloud team has extensive experience with the Microsoft portfolio that covers a range of components including Microsoft Teams, Exchange Online, SharePoint, and enterprise mobility.

AREAS OF FOCUS

The Viatek public cloud team has industry-leading knowledge and capabilities in this rapidly evolving area. Our key areas of focus include:

- **Microsoft 365 Solutions:** Viatek specialises in the deployment and ongoing management of modern workplace solutions from Microsoft 365 including; Microsoft Teams, Exchange Online, Sharepoint Online, Windows 10 and HP Business class devices and Enterprise Mobility + Security.
- **Migration to Azure:** If a client has legacy applications or services running either on-premise or in another datacentre, the Viatek team can work to convert them into an Azure-native format. This then allows them to run in the Microsoft Azure cloud and achieve all the benefits that a flexible, scalable platform can deliver.

- **Application transformation:** An organisation may wish to deploy a new application that has not been designed to run on a public cloud platform. The Viatek team can undertake sophisticated transformation practices that modify the application and ensure it can take full advantage of the resource allocation and performance benefits that the Azure can offer.
- **Hybrid cloud infrastructure:** Within many organisations, it's likely there will be some applications that are simply not suited for migration to the public cloud. When this occurs, the Viatek team designs and deploys a hybrid infrastructure that links cloud-based applications and resources with those that remain on premise. This ensures all work as a cohesive whole and deliver significant business benefits.
- **Monitoring and cost management:** The Viatek managed services team can closely monitor your public-cloud resources and ensure they are operating effectively 24/7. Maintenance tasks such as security and patch updates can also be undertaken as required. The team provides effective cost management by ensuring that only resources that are actually required are being used. Compute and storage capacity can be turned off when not in use, thereby reducing operational charges.
- **Disaster recovery and backups:** Effective DR and backups are a vital part of any IT infrastructure. The Viatek team can create Azure-based DR capabilities and arrange for automatic backups to be undertaken either in real time or at pre-agreed intervals.

WORKING WITH YOU

The rapidly evolving area of public cloud can deliver significant technical and business benefits to an organisation. At Viatek, we work with our clients to ensure they are making the most of the significant resources that are on offer.
